

Name: N. Harshith.

Course: Computer Vision.

Reg No: 192325078

AT3

Code: ITA0508

CO2 - class Test

1. Image Appears Too Bright

Technique:- Contrast stretching

- An overexposed image loses important details. because pixels intensities are concentrated at higher values.
- Contrast stretching redistributes the intensity values.
- Produces a clearer and more natural-looking image.

2. Dark Image Lacks Details.

Technique:- Gamma Correction.

- Brightens low-intensity regions without affecting bright areas.
- Improves visibility of objects in dark images.
- Preserves important image details.

3. Poor Contrast Image

Technique:- Histogram Equalization.

- Spreads pixel intensities across the full gray level range.

- Enhances image contrast and visibility.
- Makes hidden features easier to identify.

4). Uniform Intensity Distribution.

Technique:- Histogram Equalization.

- Redistributes intensity values uniformly across the histogram.
- Improves overall image brightness and contrast.
- Produces a balanced and clearer image.

5) Uneven Brightness:-

Technique : CLAHE

- Enhances contrast separately in different image regions.
- Corrects uneven illumination without over-enhancement.
- Improves visibility in both bright and dark areas.

6) Random Intensity variations.

Technique:- Gaussian Filter.

- Smooths random noise using weighted averaging.
- Preserves the overall image structure
- Produces a cleaner and smoother image

7) Noise Reduction with detail Preservation.

Technique:- Median Filter.

- Removes salt and pepper noise effectively.
- Preserves edges while reducing noise
- Maintains important image details.

8. Image Blurred After smoothing

Technique:- Unsharp Masking

- Enhances blurred edges by increasing sharpness.
- Restores fine image details.

- Improves overall image clarity.

9) Fine details Not visible

Technique:- High-pass filter

- Enhances edges and fine textures.
- Highlights high-frequency components.
- Improves feature visibility.

10) Noisy Image Before Analysis.

Technique:- Spatial Filtering.

- Removes noise before image processing.
- Preserves object boundaries and edges.
- Improves the accuracy of further analysis.
